

JetstreamWorks Air Bath Advantages

Air tubs or bubble tubs are not all the same! Superior design and function makes the difference!

Many national brand name tubs are made with an attached air chamber with holes that are drilled through the tubs. These holes are not air jets! Air flows out of the holes when the blower is on but there is always water in the chamber.

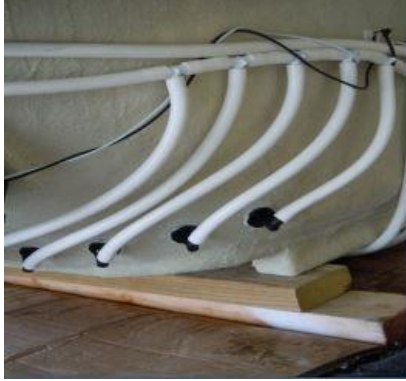

This water is never completely removed by the air flow from the purge cycle and drying could take hours or days.

JetstreamWorks Air Jetted Tubs Have the Best Design

(cut away of typical air tub)

The added air chamber design has many problems...mold, mildew, algae and grunge.

Our JetstreamWorks Air Tubs are made with individual air jets!

Real jets drain water into the tub naturally. The design is key to a clean air system. All the air supply lines are attached above the jets, so gravity removes most of the water. Then auto purge dries the air supply lines.

Heated blowers provide for a longer, warmer bath. The number and location of the air jets is optimized. Multiple speed blowers allow for air speed adjustment.

Our side mounted air jets drain water into the tub after use. Max number of air jets are placed on the side near the bottom. Air jets fill tub with bubbles and then drain correctly.
